

HOBLink JWT Key Features for the Mac

Give Mac Users fast, Web-based Access to Windows Applications on Your Windows Terminal Servers

HOBLink JWT, from HOB GmbH & Co. KG, is a platform-independent, 100% pure Java client that allows Apple® Mac® users to get fast, centralized access to Windows applications and business-critical data on Windows Terminal Servers through a web browser. And, because it's easy-to-use and flexible, HOBLink JWT does not require the large investment and complex administration that other tools do.

Open the Door to Windows Applications for Mac Users

HOBLink JWT is a fast and easy way to give Mac users on-demand, multi-user access to Windows applications. It provides high performance in Mac environments and it does not require complex server components or time-consuming administration.

With HOBLink JWT, Windows integration is seamless. All you need is HOBLink JWT and a Windows Terminal Server to get started.

HOBLink JWT for Apple Mac can be installed in two simple ways – either locally as a Java application or centralized as a Java applet on a web server. Users only need a standard web browser with a Java Virtual Machine (JVM) to access HOBLink JWT. You can also use the Java Virtual Machine that is included in the scope of delivery of HOBLink JWT.

Windows Terminal Server Access Protection

To prevent unauthorized web access to Windows Terminal Server applications and data, HOB offers an optional add-on solution – HOBLink Secure. HOBLink Secure extends the security mechanisms inherent in the Windows Terminal Server by providing SSL-based data encryption that supports different encryption keys, allowing you to create a public key infrastructure (PKI) with personal certificates. HOBLink Secure also includes a Web Secure Proxy for HOBLink JWT to prevent unauthorized web access to Windows Terminal Servers.

Save Time with Automatic Smart Update When Using HOBLink JWT on a Web Server

To ensure that your users are always working with the latest version of HOBLink JWT, the automatic Smart update feature checks for new versions on the web server. By updating at a centralized location, Smart Update saves the time that would be required for local version updates.

More information About HOBLink JWT
