

# HOB RD VPN

Safely connected. Easy to use.  
From any device to any target.

## Overview

HOB RD VPN is your universal connectivity platform:  
All inclusive, easy, secure and fast.

The ability to connect to any target from any device is now commonplace. But only HOB offers you all of the possibilities in a single, user-friendly, officially certified and technically mature software solution.

## The Challenge

A secure connection and ease of use – HOB brings it together!  
Every IT pro knows the problems with “evolved” connectivity systems that need several different clients or gateways to fulfill all of the users’ needs: Increased administrative load, greater support needs, more points-of-attack and lower satisfaction.  
HOB RD VPN has the decisive advantage: It covers all your needs.

Every user can work with their business software using any device, from any location, regardless of where the software is hosted.

## The Advantages at a Glance

- All-round-carefree package for secure remote access

### **Especially well-suited for secure, worldwide provision of:**

- Terminal Server and Web applications
- File access and IP Telephony
- Compatible with any existing infrastructure
- Easy to use: No local administrator rights, no installation
- Zero-downtime Cluster design with a surpassingly efficient gateway
- Full support in implementation and operation – direct from Germany or in your area
- Filled with technical refinements: Multi-client capability, assignment of individual roles and rights, Single Sign-On, LDAP / Active-Directory integration, supports diverse 2 factor authentication, its own certificate management, client-side compliance check, gateway-side anti-virus connection and numerous innovative additional functions.
- **NEW in Version 2.2:** Faster streaming in Terminal Server sessions, thanks to a protocol extension and improved connections for Web apps due to the newly developed WebServerGate with the innovative split gateway design – the world’s first and only!

## The Universal Solution

It supports a wide array of devices: The eponymous Remote Desktop area alone is represented with five apps, which are suitable for all mobile and “classic” browsers and operating systems. The user, of course, is automatically provided the appropriate variant. Secure access to internal Web applications is, naturally, also offered. Additionally, file-transfer, telephony and special, classic “emulations” or a character-based or graphic (SSH, X.11) UNIX connection. A PPP tunnel is also available for a universal connection of legacy applications.

The system is immensely scalable and, on the gateway-side, supports all the usual platforms. Hereby, optimal resource utilization is key for the low latency and high throughput rates. Additional technologies, such as compression make this product one of the most powerful of its kind in the market.
